

## PHYSICS FORMULAS

<p>Density is mass per unit volume Density = mass / volume</p>	<p>velocity = displacement / time</p>
<p>Force = rate of change of momentum</p>	<p>Momentum = mass . velocity</p>
<p>Power is rate of work done Power = work / time Unit of power is watt</p> <p><b>Potential energy (P)</b> PE = m.g.h m = mass g = acceleration due to gravity (9.81m/s<sup>2</sup>) h = height</p>	<p><b>Kinetic energy (P)</b> P = (1/2).m.v<sup>2</sup> m = mass v = velocity</p>
<p><b>Gravity (Force due to gravity)</b> F<sub>g</sub> : Force of attraction G : Gravitational constant M<sub>1</sub> : Mass of first object M<sub>2</sub> : Mass of second object</p> $F_g = \frac{G M_1 M_2}{r^2}$	<p>Acceleration due to gravity at a depth 'd' from earth surface is :</p> $g_d = g(1 - \frac{d}{R})$
<p>Acceleration due to gravity at height 'h' from earth surface is :</p> <p>h is very much smaller than R</p> $g_h = g(1 - \frac{2h}{R})$	<p><b>Escape velocity</b> Escape velocity from a body of mass M and radius r is</p> <p>For example if you want to calculate the escape velocity of sa object from earth then, M is dmass of earth r is radius of earth</p>
<p><b>OPTICS</b></p> <p><b>Index of refraction</b></p>	<p><b>Under constant acceleration linear motion</b></p>

<p><math>n = c/v</math></p> <p><math>n</math> - index of refraction  <math>c</math> - velocity of light in a vacuum  <math>v</math> - velocity of light in the given material</p>	<p><math>v</math> = final velocity  <math>u</math> = initial velocity  <math>a</math> = acceleration  <math>t</math> = time taken to reach velocity <math>v</math> from <math>u</math>  <math>s</math> = displacement</p> <p><math>v = u + a t</math></p> <p><math>s = ut + (1/2) a t^2</math></p> <p><math>s = vt - (1/2) a t^2</math></p> <p><math>v^2 = u^2 + 2 a s</math></p>
<p><b>Friction force (kinetic friction)</b>  When the object is moving then Friction is defined as :  <math>F_f = \mu F_n</math>  where  <math>F_f</math> = Friction force, <math>\mu</math>= coefficient of friction  <math>F_n</math> = Normal force</p>	<p><b>Linear Momentum</b>  Momentum = mass x velocity</p>
<p>Capillary action  The height to which the liquid can be lifted is given by:</p> $h = \frac{2\gamma \cos \theta}{\rho g r}$ <p><math>\gamma</math>: liquid-air surface tension (T) (T=energy/area)  <math>\theta</math>: contact angle  <math>\rho</math>: density of liquid  <math>g</math>: acceleration due to gravity  <math>r</math>: is radius of tube</p>	<p><b>Simple harmonic motion</b>  Simple harmonic motion is defined by:  <math>d^2x/dt^2 = - k x</math></p>
<p><b>Time period of pendulum</b></p>	<p><b>Waves</b></p> <p><math>\frac{1}{f}</math></p>

	$= \frac{2\pi}{T}$ $v = f \cdot \lambda$ <p>where  <math>\omega</math> = Angular frequency, T=Time period, v = Speed of wave,  <math>\lambda</math>=wavelength</p>
<p><b>Doppler effect</b> Relationship between observed frequency f and emitted frequency <math>f_0</math>:</p> $f = \frac{v}{v + v_s} f_0$ <p>where,  v=velocity of wave  <math>v_s</math>=velocity of source. It is positive if source of wave is moving away from observer. It is negative if source of wave is moving towards observer.</p>	<p><b>Resonance of a string</b></p> $f = \frac{nv}{2L}$ <p>where  L: length of the string  n = 1, 2, 3...</p>
<p><b>Resonance of a open tube of air (approximate)</b></p> $f = \frac{nv}{2L}$	<p><b>Resonance of a open tube of air (accurate)</b></p>

<p>where,  L: length of the cylinder  n = 1, 2, 3...  v = speed of sound</p>	$\text{frequency} = f = \frac{nv}{2(L+0.8D)}$ <p>where,  L: length of the cylinder  n: 1, 2, 3...  v: speed of sound  d:diameter of the resonance tube</p>
<p><b>Resonance of a closed tube of air (approximate)</b></p> $\text{Approximate frequency} = f = \frac{nv}{4L}$ <p>where,  L: length of the cylinder  n = 1, 2, 3...  v = speed of sound</p>	<p><b>Resonance of a closed tube of air (accurate)</b></p> $\text{frequency} = f = \frac{nv}{4(L+0.8D)}$ <p>where,  L: length of the cylinder  n: 1, 2, 3...  v: speed of sound  d:diameter of the resonance tube</p>
<p>intensity of sound = <math>\frac{\text{Sound Power}}{\text{area}}</math></p>	<p><b>Bragg's law</b>  <math>n\lambda = 2d \sin\theta</math></p> <p>where  n = integer (based upon order)  <math>\lambda</math> = wavelength</p>

<p>intensity of sound in decibel=</p> $10 \log_{10} \frac{I}{I_0}$ <p>dB = <math>10 \log_{10} \frac{I}{I_0}</math> where  I=intensity of interest in <math>\text{Wm}^{-2}</math>  <math>I_0</math>=intensity of interest in <math>10^{-12} \text{Wm}^{-2}</math></p>	<p>d = distance between the planes  <math>\theta</math> = angle between the surface and the ray</p>
<p><b>de Broglie equation</b></p> $\lambda = \frac{h}{p} = \frac{h}{mv}$ <p>where  p = momentum  <math>\lambda</math> = wavelength  h = Planck's constant  v = velocity</p>	<p><b>Relation between energy and frequency</b></p> <p>E = <math>h\nu</math>  where  E = Energy  h = Planck's constant  <math>\nu</math> = frequency</p>
<p><b>Davisson and Germer experiment</b></p> $\lambda = \frac{h}{mv}$	<p><b>Centripetal Force (F)</b></p> $F = \frac{mv^2}{r} = m\omega^2 r$

<p>where  e = charge of electron  m = mass of electron  V = potential difference between the plates thru which the electron pass  λ = wavelength</p>	
<p><b>Circular motion formula</b></p> <p><math>v = \omega r</math></p> <p style="text-align: right;"><math>v</math></p> <p>Centripetal acceleration (a) <math>\frac{v^2}{r}</math></p>	<p><b>Torque (it measures how the force acting on the object can rotate the object)</b></p> <p>Torque is cross product of radius and Force</p> <p>Torque = (Force) X (Moment arm) X sin θ</p> <p>T = F L sin θ</p> <p>whete θ = angle between force and moment arm</p>
<p><b>Forces of gravitation</b></p> <p><math>F = G (m_1 \cdot m_2) / r^2</math></p> <p>where G is constant. G = 6.67E - 11 N m<sup>2</sup> / kg<sup>2</sup></p>	<p><b>Stefan-Boltzmann Law</b></p> <p>The energy radiated by a blackbody radiator per second = P</p> <p><math>P = A\sigma T^4</math></p> <p>where,  σ = Stefan-Boltzmann constant  σ = 5.6703 × 10<sup>-8</sup> watt/m<sup>2</sup>K<sup>4</sup></p>
<p><b>Efficiency of Carnot cycle</b></p> <p><math>\eta = 1 - \frac{T_c}{T_h}</math></p>	<p><b>Ideal gas law</b></p> <p><math>P V = n R T</math></p> <p>P = Pressure (Pa i.e. Pascal)  V = Volume (m<sup>3</sup>)  n = number of of gas (in moles)  R = gas constant ( 8.314472 .m<sup>3</sup>.Pa.K<sup>-1</sup>mol<sup>-1</sup> )  T = Temperatur ( in Kelvin [K])</p>
<p><b>Boyles law (for ideal gas)</b></p> <p><math>P_1 V_1 = P_2 V_2</math></p> <p>T (temperature is constant)</p>	<p><b>Charles law (for ideal gas)</b></p>

	$V_1 = V_2$ $T_1 = T_2$ <p>P (pressure is constant)</p>
<p><b>Translational kinetic energy K per gas molecule (average molecular kinetic energy:)</b></p> $K = \frac{3}{2} k T$ <p><math>k = 1.38066 \times 10^{-23} \text{ J/K}</math> Boltzmanns constant</p>	<p><b>Internal energy of monoatomic gas</b></p> $K = \frac{3}{2} n R T$ <p>n = number of of gas (in moles) R = gas constant ( <math>8.314472 \text{ J}\cdot\text{mol}^{-1}\cdot\text{K}^{-1}</math> )</p>
<p><b>Root mean square speed of gas</b></p> $V_{\text{rms}}^2 = \frac{3 k T}{m}$ <p><math>k = 1.38066 \times 10^{-23} \text{ J/K}</math> Boltzmanns constant m = mass of gas</p>	<p><b>Ratio of specific heat (<math>\gamma</math>)</b></p> $\gamma = \frac{C_p}{C_v}$ <p><math>C_p</math> = specific heat capacity of the gas in a constant pressure process <math>C_v</math> = specific heat capacity of the gas in a constant</p>

	volume process
<p><b>Internal entergy of ideal gas</b></p> <p>Internal entergy of ideal gas  <math>(U) = c_v nRT</math></p>	<p>In <b>Adiabatic process</b> no heat is gained or lost by the system.  Under adiabatic condition</p> <p><math>PV^\gamma = \text{Constant}</math>  <math>TV^{\gamma-1} = \text{Constant}</math>  where <math>\gamma</math> is ratio of specific heat.</p> <p style="text-align: center;"><math>C</math></p> <p style="text-align: center;"><math>\gamma \frac{p}{v}</math></p> <p style="text-align: center;"><math>= C</math></p> <p style="text-align: center;"><math>v</math></p>
<p><b>Boltzmann constant (k)</b></p> <p style="text-align: center;"><math>k = \frac{R}{N_a}</math></p> <p>R = gas constant  <math>N_a</math> = Avogadro's number.</p>	<p><b>Speed of the sound in gas</b></p> <p>R = gas constant (8.314 J/mol K)  T = the absolute temperature  M = the molecular weight of the gas (kg/mol)  <math>\gamma</math> = adiabatic constant = <math>c_p/c_v</math></p>
<p><b>Capillary action</b>  The height to which the liquid can be lifted is given by  h=height of the liquid lifted  T=surface tension  r=radius of capillary tube</p> <p><math>h = \frac{2T}{\rho r}</math></p>	<p><b>Resistance of a wire</b></p> <p style="text-align: center;"><math>R = \frac{\rho L}{A}</math></p> <p style="text-align: center;"><math>A</math></p> <p style="text-align: center;"><math>\rho = \text{rsistivity}</math>  L = length of the wire</p>

<p style="text-align: center;">— g</p>	<p>A = cross-sectional area of the wire</p>
<p><b>Ohm's law</b>  <math>V = I \cdot R</math>  V = voltage applied  R = Resistance  I = current</p> <p><b>Electric power (P) = (voltage applied) x (current)</b>  <math>P = V \cdot I = I^2 \cdot R</math>  V = voltage applied  R = Resistance  I = current</p>	<p><b>Resistor combination</b>  <b>If resistors are in series then equivalent resistance will be</b>  <math>R_{eq} = R_1 + R_2 + R_3 + \dots + R_n</math>  <b>If resistors are in parallel then equivalent resistance will be</b>  <math>1/R_{eq} = 1/R_1 + 1/R_2 + 1/R_3 + \dots + 1/R_n</math></p>
<p>In AC circuit average power is :  <math>P_{avg} = V_{rms} I_{rms} \cos\phi</math>  where,  <math>P_{avg}</math> = Average Power  <math>V_{rms}</math> = rms value of voltage  <math>I_{rms}</math> = rms value of current</p>	<p>In AC circuit Instantaneous power is :  <math>P_{Instantaneous} = V_m I_m \sin\omega t \sin(\omega t - \phi)</math>  where,  <math>P_{Instantaneous}</math> = Instantaneous Power  <math>V_m</math> = Instantaneous voltage  <math>I_m</math> = Instantaneous current</p>
<p><b>Capacitors</b>  <math>Q = C \cdot V</math>  where  Q = charge on the capacitor  C = capacitance of the capacitor  V = voltage applied to the capacitor</p>	<p><b>Total capacitance (Ceq) for PARALLEL Capacitor</b>  <b>Combinations:</b>  <math>C_{eq} = C_1 + C_2 + C_3 + \dots + C_n</math>  <b>Total capacitance (Ceq) for SERIES Capacitor</b>  <b>Combinations:</b>  <math>1/C_{eq} = 1/C_1 + 1/C_2 + 1/C_3 + \dots + 1/C_n</math></p>
<p><b>Parallel Plate Capacitor</b></p> $C = \kappa \frac{\epsilon_0 A}{d}$	<p><b>Cylindrical Capacitor</b></p> $C = 2\pi\kappa \frac{\epsilon_0 L}{\ln}$

<p>where  C = [Farad (F)]  κ = dielectric constant  A = Area of plate  d = distance between the plate  ε<sub>0</sub> = permittivity of free space (8.85 X 10<sup>-12</sup> C<sup>2</sup>/N m<sup>2</sup>)</p>	<p style="text-align: center;">(b/a)</p> <p>where  C = [Farad (F)]  κ = dielectric constant  L = length of cylinder [m]  a = outer radius of conductor [m]  b = inner radius of conductor [m]  ε<sub>0</sub> = permittivity of free space (8.85 X 10<sup>-12</sup> C<sup>2</sup>/N m<sup>2</sup>)</p>
<p><b>Spherical Capacitor</b></p> $C = 4 \pi \kappa \frac{a b}{\epsilon_0 (b - a)}$ <p>where  C = [Farad (F)]  κ = dielectric constant  a = outer radius of conductor [m]  b = inner radius of conductor [m]  ε<sub>0</sub> = permittivity of free space (8.85 X 10<sup>-12</sup> C<sup>2</sup>/N m<sup>2</sup>)</p>	<p><b>Magnetic force acting on a charge q moving with velocity v</b></p> $F = q v B \sin \theta$ <p>where  F = force acting on charge q (Newton)  q = charge (C)  v = velocity (m/sec<sup>2</sup>)  B = magnetic field  θ = angle between v (velocity) and B (magnetic field)</p>
<p><b>Force on a wire in magnetic field (B)</b></p> $F = B I l \sin \theta$ <p>where  F = force acting on wire (Newton)  I = Current (Ampere)  l = length of wire (m)  B = magnetic field  θ = angle between I (current) and B (magnetic field)</p>	<p>In an RC circuit (Resistor-Capacitor), the time constant (in seconds) is:  τ = RC  R = Resistance in Ω  C = Capacitance in farads.</p>

<p>In an RL circuit (Resistor-inductor ), the time constant (in seconds) is:  <math>\tau = L/R</math>  R = Resistance in <math>\Omega</math>  C = Inductance in henries</p>	<p>Self inductance of a solenoid = <math>L = \mu n^2 LA</math>  n = number of turns per unit length  L = length of the solenoid.</p>
<p>Mutual inductance of two solenoid two long thin solenoids, one wound on top of the other  <math>M = \mu_0 N_1 N_2 LA</math>  <math>N_1</math> = total number of turns per unit length for first solenoid  <math>N_2</math> = number of turns per unit length for second solenoid  A = cross-sectional area  L = length of the solenoid.</p>	<p>Energy stored in capacitor  <math>E = \frac{1}{2} CV^2</math></p>
<p><b>Coulomb's Law</b>  Like charges repel, unlike charges attract.  <math>F = k (q_1 \cdot q_2) / r^2</math>  where k is constant. <math>k = 1 / (4 \pi \epsilon_0) \approx 9 \times 10^9 \text{ N.m}^2/\text{C}^2</math>  <math>q_1</math> = charge on one body  <math>q_2</math> = charge on the other body  r = distance between them</p> <p><a href="#">Calculator based upon Coulomb's Law</a></p>	<p>Ohm's law  <math>V = IR</math>  where  V = voltage  I = current  R = Resistance</p>
<p><b>Electric Field around a point charge (q)</b>  <math>E = k ( q/r^2 )</math>  where k is constant. <math>k = 1 / (4 \pi \epsilon_0) \approx 9 \times 10^9 \text{ N.m}^2/\text{C}^2</math>  q = point charge  r = distance from point charge (q)</p>	<p><b>Electric field due to thin infinite sheet</b></p> $E = \frac{\sigma}{2 \epsilon_0}$ <p>where  E = Electric field (N/C)  <math>\sigma</math> = charge per unit area <math>\text{C}/\text{m}^2</math>  <math>\epsilon_0 = 8.85 \times 10^{-12} \text{ C}^2/\text{N}</math></p>

	m <sup>2</sup>
<p><b>Electric field due to thick infinite sheet</b></p> $E = \frac{\sigma}{\epsilon_0}$ <p>where</p> <p>E = Electric field (N/C)  σ = charge per unit area C/m<sup>2</sup>  ε<sub>0</sub> = 8.85 X 10<sup>-12</sup> C<sup>2</sup>/N m<sup>2</sup></p>	<p><b>Magnetic Field around a wire (B) when r is greater than the radius of the wire.</b></p> $B = \frac{\mu_0 I}{2\pi r}$ <p>where</p> <p>I = current  r = distance from wire  and r ≥ Radius of the wire</p>
<p><b>Magnetic Field around a wire (B) when r is less than the radius of the wire.</b></p> $B = \frac{\mu_0 I r}{R^2}$ <p>where</p> <p>I = current  R = radius of wire  r = distance from wire  and r ≤ Radius of the wire (R)</p>	<p><b>Magnetic Field At the center of an arc</b></p> $B = \frac{\mu_0 I \phi}{4\pi r}$ <p>where</p> <p>I = current  r = radius from the center of the wire</p>
<p><b>Bohr's model</b></p> $L = nh$	<p><b>Emitting Photons (Rydberg Formula)</b></p> $\frac{1}{\lambda} = R \left( \frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$

$= \frac{2\pi}{h} \sqrt{L(L+1)}$ <p>where  L = angular momentum  n = principal quantum number  = 1, 2, 3, ... n  h = Planck's constant.</p>	$= \frac{2\pi}{h} \sqrt{n_1^2 - n_2^2}$ <p>where  <math>n_1 &lt; n_2</math>  <math>E_0 = 13.6 \text{ eV}</math></p>
<p><b>Half life of radioactive element</b></p> $t_{1/2} = \frac{\ln(2)}{\lambda}$	<p><b>Average life of radioactive element</b></p> $\tau = \frac{1}{\lambda}$
